Alzheimer MRI Screening – Patient Report

Patient: QWERT (ALZ-13FC0A) | Scans on record: 3

Scan history

#	Date	Predicted stage	Confidence	Main region	Status
1	2026-11-03	MildDemented	99.8%	ventricular / central	approved
2	2026-11-03	VeryMildDemented	99.8%	ventricular / central	pending
3	2026-11-03	VeryMildDemented	99.8%	ventricular / central	pending

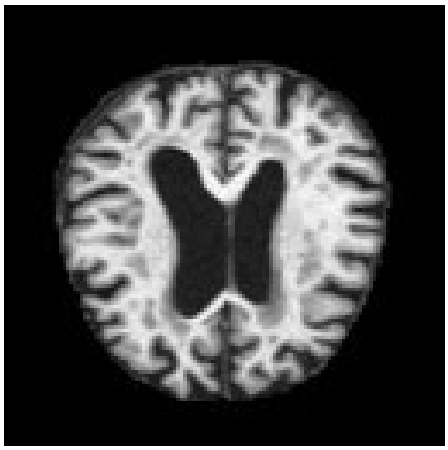

Overall: from MildDemented (2026-11-03) to VeryMildDemented (2026-11-03) the model's predicted stage has decreased.

Scan 1 of 3 – 2026-11-03

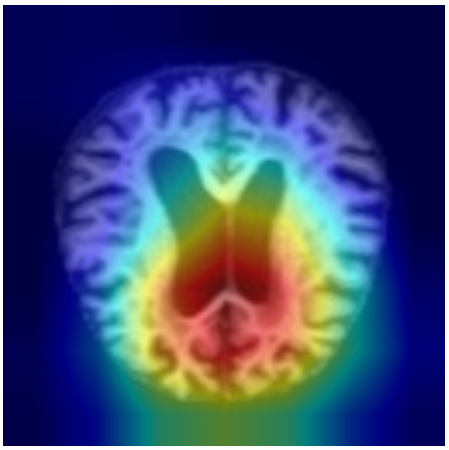

Case: CASE-1793714563-2A0A | Date: 2026-11-03 14:02 UTC

Predicted stage: MildDemented (99.8%)

NonDemented	0.0%
VeryMildDemented	0.1%
MildDemented	99.8%
ModerateDemented	0.0%

Input MRI

Grad-CAM heatmap

Brain region contributing most: ventricular / central

Reason for detection

The model classified this scan as MildDemented with high confidence (99.8%) because its attention was concentrated in the central region near the ventricles. This is consistent with moderate structural changes, including some enlargement of the ventricles, which is a pattern typically seen in milddemented cases.

Summary

The model predicts MildDemented for patient QWERT with high confidence.

Imaging findings

The model's predictions are consistent with the patient's stage being MildDemented, with a probability of 99.8%.

Interpretation

The high confidence in the model's prediction suggests that the results are reliable, but the absence of a previous scan limits the ability to track longitudinal changes.

Trend

No earlier scan is on record for this patient.

Limitations

The model's performance may be influenced by the lack of a previous scan, and the results should be treated with caution due to the high confidence in the prediction.

Suggested next steps

- Consult a neurologist for clinical evaluation and cognitive testing.
- Discuss support planning and home safety with the care team.
- This is a model screening output; a qualified clinician must confirm any finding.

Status: approved.

Scan 2 of 3 – 2026-11-03

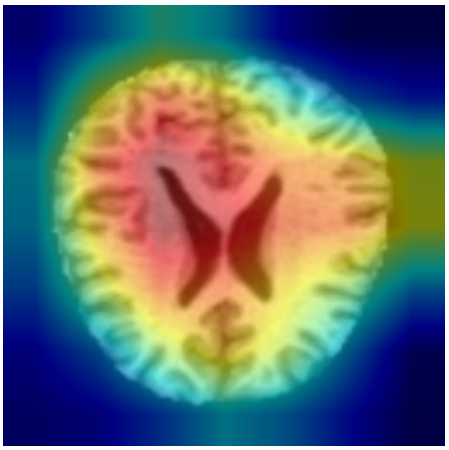

Case: CASE-1793715132-B5DE | Date: 2026-11-03 14:12 UTC

Predicted stage: VeryMildDemented (99.8%)

NonDemented	0.2%
VeryMildDemented	99.8%
MildDemented	0.0%
ModerateDemented	0.0%

Input MRI

Grad-CAM heatmap

Brain region contributing most: ventricular / central

Reason for detection

The model classified this scan as VeryMildDemented with high confidence (99.8%) because its attention was concentrated in the central region near the ventricles. This is consistent with subtle, early structural changes, which is a pattern typically seen in verymilddemented cases.

Summary

The model predicts a high confidence diagnosis of VeryMildDemented for patient QWERT.

Imaging findings

The model's prediction is consistent with the patient's current stage of VeryMildDemented. The central region near the ventricles is highlighted as a region of interest by the GradCAM analysis.

Interpretation

The high confidence level of 99.8% suggests that the model is highly confident in its prediction. However, the low probability of 0.2% for NonDemented suggests that there is some uncertainty in the model's decision.

Trend

The patient's condition has improved from MildDemented to VeryMildDemented over the past year, with a change in stage of 1 and a total of 2 scans on record.

Limitations

The model's performance should be treated with caution due to the low confidence band. The model's prediction is based on a single scan, and further evaluation is needed to confirm the diagnosis.

Suggested next steps

- Subtle early changes were flagged; discuss with a neurologist or memory clinic.
- Clinician-administered cognitive screening is commonly used to follow up.
- This is a model screening output; a qualified clinician must confirm any finding.

Status: pending.

Scan 3 of 3 (latest) – 2026-11-03

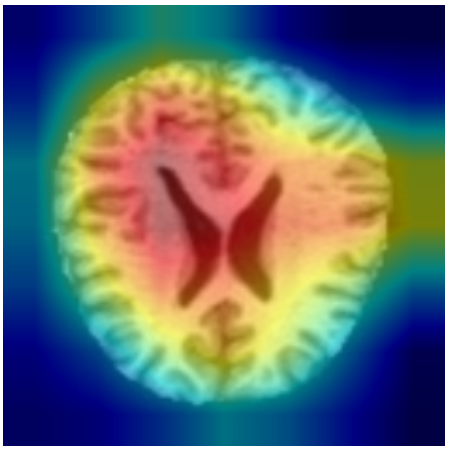

Case: CASE-1793715166-FDFC | Date: 2026-11-03 14:12 UTC

Predicted stage: VeryMildDemented (99.8%)

NonDemented	0.2%
VeryMildDemented	99.8%
MildDemented	0.0%
ModerateDemented	0.0%

Input MRI

Grad-CAM heatmap

Brain region contributing most: ventricular / central

Reason for detection

The model classified this scan as VeryMildDemented with high confidence (99.8%) because its attention was concentrated in the central region near the ventricles. This is consistent with subtle, early structural changes, which is a pattern typically seen in verymilddemented cases.

Summary

The model predicts a high confidence in the patient's current stage as VeryMildDemented.

Imaging findings

The model's prediction is consistent with the patient's current stage as VeryMildDemented, with a high confidence level of 99.8%. The probabilities suggest a strong likelihood of VeryMildDemented (99.8%) and a low likelihood of NonDemented (0.2%).

Interpretation

The model's prediction is consistent with the patient's current clinical status. However, the result should be treated with caution due to the high confidence level, which may indicate overfitting or other issues.

Trend

The patient's trend shows no significant change in stage over the past scan, with the stage remaining VeryMildDemented. This is consistent with the model's prediction of an unchanged trend.

Limitations

The model's high confidence level may be influenced by overfitting or other biases. The result should be treated cautiously and considered in conjunction with other clinical information.

Suggested next steps

- Subtle early changes were flagged; discuss with a neurologist or memory clinic.
- Clinician-administered cognitive screening is commonly used to follow up.
- This is a model screening output; a qualified clinician must confirm any finding.

Status: pending.
