Alzheimer MRI Screening Report

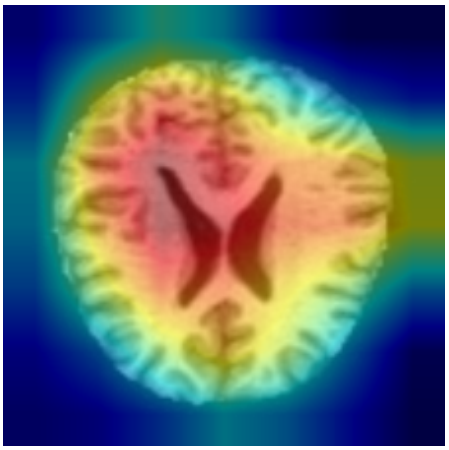

Patient: QWERT (ALZ-13FC0A) | Case: CASE-1793715132-B5DE | Date: 2026-11-03

Predicted stage: VeryMildDemented (99.8%)

NonDemented	0.2%
VeryMildDemented	99.8%
MildDemented	0.0%
ModerateDemented	0.0%

Input MRI

Grad-CAM heatmap

Brain region contributing most: ventricular / central

Reason for detection

The model classified this scan as VeryMildDemented with high confidence (99.8%) because its attention was concentrated in the central region near the ventricles. This is consistent with subtle, early structural changes, which is a pattern typically seen in verymilddemented cases.

Summary

The model predicts a high confidence diagnosis of VeryMildDemented for patient QWERT.

Imaging findings

The model's prediction is consistent with the patient's current stage of VeryMildDemented. The central region near the ventricles is highlighted as a region of interest by the GradCAM analysis.

Interpretation

The high confidence level of 99.8% suggests that the model is highly confident in its prediction. However, the low probability of 0.2% for NonDemented suggests that there is some uncertainty in the model's decision.

Trend

The patient's condition has improved from MildDemented to VeryMildDemented over the past year, with a change in stage of 1 and a total of 2 scans on record.

Limitations

The model's performance should be treated with caution due to the low confidence band. The model's prediction is based on a single scan, and further evaluation is needed to confirm the diagnosis.

Suggested next steps

- Subtle early changes were flagged; discuss with a neurologist or memory clinic.
- Clinician-administered cognitive screening is commonly used to follow up.
- This is a model screening output; a qualified clinician must confirm any finding.

Status: pending. Educational AI-generated screening report. Not a medical device and not a diagnosis; must be reviewed by a qualified clinician.
